Permanent stormwater management facility used as temporary sediment pond with skimmer during construction phase.

NOTE

1) Fill gap between Watermann and structure with expandable grout (standard 8" orifice to be cored in bottom of outlet structure for Watermann to be installed through).
2) Install temporary cap (pond side) on Channel Protection discharge pipe (to be removed and 90 degree elbow added once construction/site stabilization is complete).
3) Watermann clean-out cap to have dewatering orifice drilled in cap and sized to drain the pond in a specific time period.
4) After construction/site stabilization the skimmer is removed and Watermann system installed.
